Summary:

When I entered <https://www.bayut.com>, Chrome first converted the domain name into the IP address (172.175.234.12) using DNS. It then created a secure HTTPS connection and sent an HTTP GET request with headers like User-Agent, Accept, and Accept-Encoding. The server responded with 204 No Content for that request. Chrome then downloaded the required HTML, CSS, JavaScript, images, and fonts, processed them, and displayed the final web page.

Flow:

URL → DNS Lookup → IP Address → HTTPS Connection → HTTP Request → Server Response → Download Resources (HTML/CSS/JS/Images) → Render Web Page
